2. In *her.*, an animal represented with the tail hanging down, or turned up between the legs, as a lion or other beast of prey. Also *coué*. =Syn. 1. *Coward*, *Poltroon*, *Craven*, *Dastard*, *Pusillanimous* (person) express an ignoble quality of fear, or fear showing itself in dishonorable ways. *Coward* is the general word, covering the others, is most often used, and is least opprobrious. *Poltroon*, *craven*, and *dastard* are highly energetic words, used only in the effort to make a person's cowardice seem contemptible. The distinction between them is not clearly marked. A *poltroon* has somewhat more of the mean-spirited and contemptible in his character; a *craven* skulks away, accepts any means of escape, however dishonorable, from a dangerous position, duty, etc.; a *dastard* is base, and therefore despicable, in his cowardice. *Dastard* is the strongest of these words. A *pusillanimous* person is, literally, one of little courage; his cowardice is only the most conspicuous part of a general lack of force in mind and character, making him spiritless and contemptible.

In *entom.*, the first or basal joint (sometimes called the hip) of an insect's leg, by which it is articulated to the body. It may be entirely uncovered, as in many flies, or received into a coxal cavity or deep hollow in the lower surface of the thorax, as in most beetles. *Coxae* are said to be *contiguous* when those of a pair are close together, *separate* when there is a space between them, *distant* when they are widely separate, *prominent* when they protrude from the coxal cavities, *globose* when they are shaped like a ball, *transverse* when they lie across the body with the succeeding joint of the leg attached to the inner end, etc. These distinctions are of great value in classification. Sometimes the *coxa* has a small accessory piece called the *trochanter*, which, however, is not a true joint. Some of the older entomologists included the first two joints of the leg in the term *coxa*, the first being distinguished as the *patella* and the second as the *trochanter*.

Much use is made of these characters in classification.—**COXAL LINES**, in *entom.*, two curved, slightly prominent lines on the first ventral abdominal segment of certain *Coleoptera*, behind the *coxae*. They limit a space which is inclined toward the base of the abdomen, passing under the *coxae*.

(See quotation from Bulwer, under *exquisite*.) *Beau* is an old name for one who has too much understanding to be a mere dandy, but still overdoes in the matter of dress, sometimes carrying it to an extreme, as *Beau Nash*, *Beau Brummel*. *Beau Brummel* might perhaps be called the typical *fop*.

Most *coxcombs* are not of the laughing kind;

A machine for moving weights, having two motions, one a direct lift and the other horizontal. The latter may be circular, radial, or universal. The parts of the simple crane are an upright post having a motion on its vertical axis, a jib or swinging arm jointed at its lower end to the post and tied to the post at its outer or upper end, and hoisting tackle connecting the motive power at the foot of the post with the load to be lifted, which is suspended from the end of the jib. Cranes are, however, made in a variety of forms, differing more or less from this type. Thus, a *rotary crane* is a crane in which the jib has simply a rotary motion about the axis of the post, moving with the post; a *traveling crane* is a crane in which the load can be given successively two horizontal motions at right angles with each other. Rotary cranes, again, have several forms, as that in which the load is suspended from the end of the

Traveling Crane.

jib, and the more complex kind, in which the load is suspended from a carriage that travels on a horizontal arm at the top of the jib, and gives the load a movement along the radius of the circle formed by the rotation of the jib. Another minor type is the *derrick-crane*, which employs guys to hold the post in position. *Walking* and *locomotive cranes* are portable forms, which are also called *traveling cranes*. Cranes are operated by any kind of power and with any form of hoisting apparatus suited to the work to be done. See also cut under *abutment-crane*.

crank² (krangk), *n.* [*< ME. cranke*; perhaps < AS. **cranc*, in comp. **cranc-staf*, an unauthenticated form in Somner, defined as "some kind of weavers instrument"; appar. < *crank¹*, *a.*, bent, crooked, which is, however, not recorded in ME. or AS.: see *crank¹*, *a.*] 1. A bent or vertical arm attached to or projecting at an angle from an axis at one end, and with provision for the application of power at the other, used for communicating circular motion, as in a grindstone, or for changing circular into reciprocating motion, as in a saw-mill, or reciprocating into circular motion, as in a steam-engine. The *single crank* (1) can be used only on the end of an axis. The *double crank* (2) is employed when it is necessary that the axis should be extended on both sides of the point at which the reciprocating motion is applied. An exemplification of this arrangement is afforded by the machinery of steam-vessels. The *bell-crank* (3), so called from its ordinary use in bell-hanging, performs a function totally different from that of the others, being used merely to change the direction of a reciprocating motion, as from a horizontal to a vertical line.

In the Greek and Roman Catholic churches the creed of the church is regarded as of equal authority over the believer with the Bible. The principal historical creeds of Christendom are the following: the *Apostles' Creed* (see *apostle*) and the *Nicene Creed* (see *Nicene*), both originating in the fourth century, and generally accepted by Christian churches, Protestant, Greek, and Roman Catholic; the *Athanasian Creed* (see *Athanasian*), retained by the Church of England, but not by the Protestant Episcopal Church in the United States, nor by other Protestant communities; the *Decrees of the Council of Trent* (A. D. 1563), the great symbol of Romanism (see *Tridentine*); the *Orthodox Confession of Mojilas* (seventeenth century), and the creed ratified by the Synod of Jerusalem (1672), both recognized by the Greek Church; the *Augsburg Confession* (1530), the symbol of the Lutheran Church; the *Helvetic Confessions* (two confessions, a first and a second Helvetic Confession, 1536, 1566), adopted by Swiss theologians as a statement of the reformed faith of the Swiss churches; the *Westminster Confession of Faith* (1647), the symbol of the Presbyterian Church; the *Canons of the Synod of Dort* (1619), aimed especially at Arminianism, and still regarded as a symbol of doctrine by the Reformed Church of the Netherlands and the Reformed (Dutch) Church in America; the *Thirty-nine Articles* (1563-71) of the Church of England and (revised in 1801) of the Protestant Episcopal Church in the United States; the *Savoy Confession* (1658), a Congregational symbol, and formerly generally accepted by Congregationalists; and the *Twenty-five Articles of the Methodist Episcopal Church* (1784), of which the first twenty-four were prepared by John Wesley, on the basis of the Thirty-nine Articles of the Church of England. A number of other special declarations of faith by other Protestant bodies are of less historical significance. The word *creed*, however, in its strict sense applies only to comparatively brief formulae of profession of faith (as the Apostles' Creed), beginning with the words "I believe" or "We believe," and intended to be used at baptism or reception of converts, or in public worship.

The revival of the practice in a more efficient manner has been advocated in recent times for sanitary reasons, and to some extent effected. Various methods of cremation have been proposed, the great difficulty being to consume the body without permitting the escape of noxious exhalations, and without defiling the ashes with foreign substances. In W. Siemens's apparatus (a modification of the plan of Sir Henry Thompson) the body is exposed to the combined action of highly heated air and combustible gases, so as to be entirely consumed without foreign admixture, while the furnace is so constructed that no noxious effluvia escapes from it.

(Compare *aspret*.) The crest in medieval armor was early affected by heraldic considerations (see (b)), whether formally, as being the heraldic crest itself, or by the necessity of using a badge or cognizance, whether temporary or permanent: thus, the tilting-helmet was often surmounted by an elaborate structure in cuir-bouilli or even in thin metal, representing an animal or the head of an animal, or a human figure.

extended to certain species of the related family *Locustidae*. In both these families the antennæ are very long and filamentous, with sometimes upward of 100 joints, and the ovipositor is often very large. It is to the saltatorial forms, as distinguished from the *Achetidae* (grasshoppers), that the name *cricket* is usually applied. The best-known species is the common house-cricket, *Acheta* or *Gryllus domestica*. The field-cricket is *Acheta* or *Gryllus campestris*; the mole-cricket, *Gryllotalpa vulgaris*; the grand cricket of New Zealand, *Anostotoma* or *Dinacrida heteracantha*. See also *sand-cricket*.

cricket² (krik'et), *n.* [The game is first mentioned in A. D. 1598; prob. < OF. *criquet*, a stick which serves as a mark in the game of bowls (Roquefort); or perhaps another use of *cricket*³, a low stool (applied to the wickets?).] The word is certainly not from AS. *crice*, *eryce*, a staff, erutch, as usually asserted.] An open-air game played with bats, ball, and wickets, long peculiar to England, but now popular throughout the British empire, and somewhat less so in the United States and elsewhere. It is played by two opposite sets or sides of players, numbering 11 players each. Two wickets of 3 stumps 27 inches high, with 2 balls each 4 inches long on top, are placed in the ground 22 yards apart. A line known as the *bowling-crease* is drawn through and parallel to the stumps, 6 feet 8 inches in length, behind which the bowler must stand. Four feet in front of this is another line, known as the *popping-crease*, of at least as great a length as the *bowling-crease*; between these two the batsman stands. After the rival sides have tossed for the choice of taking the bat or fielding, two men are sent to the wickets, bat in hand. The opposite or fielding side are all simultaneously engaged: one (the bowler) being stationed behind one wicket for the purpose of bowling his ball against the opposite wicket,

where another player (the wicket-keeper) stands ready to catch the ball should it not be batted; the other fielders are placed in different parts of the field, so as to catch or stop the ball after it has been struck by the batsman or missed by the wicket-keeper. Their positions and names are shown in the diagram. It is the object of the batsman to prevent the ball delivered by the bowler from knocking the balls off his wicket, either by merely stopping the ball with his bat or driving it away to a distant part of the field. Should the ball be driven to any distance, or not stopped by the wicket-keeper, the two batsmen run across and exchange wickets once or more. Each time this is done is counted as a "run," and is marked to the credit of the striker. If the batsman, however, allows the ball to carry away a ball or a stump, either when the ball is bowled or while he is running from wicket to wicket, if he knocks down any part of his own wicket, if any part of his person stops a ball that would otherwise have reached his wicket, or if he strikes a ball so that it is caught by one of the opposite party before it reaches the ground, he is "out"—that is, he gives up his place to one of his own side; and so the game goes on until 10 of the 11 men have played and been put out. This constitutes an "innings." The side in the field then take their turn at the bat. Generally after two innings have been played by both sides the game comes to an end, that side winning which has scored the greater number of runs. A rude form of the game is known to have been played in the thirteenth century.

Sometimes confined to prosecution by indictment.—**Criminal psychology**. See *psychology*.—**Syn. 2. Illegal, Criminal, Felonious, Sinful, Immoral, Wicked, Iniquitous, Degraded, Dissolute, Vicious**, agree in characterizing an act as contrary to law, civil or moral. All except *illegal* and *felonious* are also applicable to persons, thoughts, character, etc. *Illegal* is simply that which is not permitted by human law, or is vitiated by lack of compliance with legal forms: as, an *illegal* election. It suggests penalty only remotely. If at all, *Criminal* applies to transgressions of human law with especial reference to penalty. *Felonious* applies to that which is deliberately done in the consciousness that it is a crime; its other uses are nearly or quite obsolete.

Sinful and the words that follow it mark transgression of the divine or moral law. *Sinful* does not admit the idea that there is a moral law separate from the divine will, but is specifically expressive of "any want of conformity unto, or transgression of, the will of God" (*Shorter Catechism*, Q. 14). As such, it applies to thoughts, feelings, desires, character, while human law looks no further back of action than to intent (as, a *criminal* intent), and attempts to deal only with acts. Hence, though all men are *sinful*, all are not *criminal*. *Immoral* stands over against *sinful* in emphasizing the notion of a moral law, apart from the question of the divine will; its most frequent application is to transgressions of the moral code in regard to the indulgence of lust. *Wicked* bears the same relation to moral law that *felonious* bears to civil law; the *wicked* man does wrong wilfully and knowingly, and generally his conduct is very wrong. *Iniquitous* is wicked in relation to others' rights, and grossly unjust: as, a most *iniquitous* proceeding. *Depraved* implies a fall from a better character, not only into wickedness, but into such corruption that the person delights in evil for its own sake. *Dissolute*, literally, set loose or released, expresses the character, life, etc., of one who throws off all moral obligation. *Vicious*, starting with the notion of being addicted to vice, has a wide range of meaning, from cross to wicked; it is the only one of these words that may be applied to animals. See *crime, atrocious, nefarious, and irreligious*.

A subject may arrest for treason: the King cannot; for, if the arrest be *illegal*, the party has no remedy against the King. Quoted in *Macaulay, On Hallam's Const. Hist.*

Kant's general conclusion was that metaphysics as a dogmatic science is impossible; but that the ideas of God, free will, etc., are valid from a practical (that is, ethical) point of view. His most important doctrines are that space and time are merely a priori forms of sense, and the categories (causality, etc.) a priori forms of the understanding. crocodile (krok'ō-dil), *n.* and *a.* [Early mod. E. also *crocodil*; altered, to suit the mod. F. and L., from ME. *cocodrill*, *cokadrill*, *cokedril*, etc., = Pr. *cocodrill* = Sp. Pg. *cocodrilo* = It. *cocodrillo* = MHG. *koddrille* (ML. *cocodrillus*, *cocodrillus*), etc., corrupted from the normal form, now in part restored, F. *crocodile* = Sp. Pg. It. *crocodilo* = D. *krokodil* = G. *krokodil* = Dan. *krokodille* = Sw. *krokodil*, < L. *crocodilus*, < Gr. *κροκόδειλος*, a lizard, a crocodile; ulterior origin unknown. Cf. *cocatrice*.] I. *n.* 1. An animal of the order *Crocodylia*, and especially of the family *Crocodylidae* (see these words). The name, originally signifying some large lizard, was first specifically given to the Nile crocodile, *Crocodylus niloticus* or *vul-*

garis, the member of the order which has been longest and best known, and was afterward extended to sundry related species. Thus, the Gangetic crocodile is the gaval, *Gavialis gangeticus*. A true crocodile, *Crocodylus americanus*, occurs in Florida.

Mandeville, *Travels*, p. 169.

2. In *logic*, a sophism of counter-questioning. Thus, in the old example, a crocodile has stolen a child, and promises to restore it to the father if the latter an-

swers correctly his question, Am I going to restore the child? If the father says Yes, the crocodile eats the child and tells the father he is wrong. If the father says No, the reply is that in that case the child cannot be restored, for to do so would violate the agreement, since the father's answer would then be incorrect.

II. *a.* Like a crocodile, or like something pertaining to a crocodile.—**Crocodile tears**, false or simulated tears: in allusion to the fiction of old travelers that crocodiles shed tears over those they devour.

Crocodylia (krok'ō-dil'i-ā), *n. pl.* [NL., < L. *crocodilus*, crocodile.] An order of *Reptilia*, formerly included with *Lacertilia* in *Sauria*, now separated as the highest existing reptiles. They are lizard-like in form, with long tails and four well-developed limbs, the anterior shorter than the posterior and with five complete digits, and the posterior four-toed. With a single exception, the living species have nails on the three radial and tibial digits; the feet are webbed; the nostrils are at the end of a long snout, and can be closed; and the tympanic membranes are exposed, but a cutaneous valve can be shut down over them. The skin is loricate, the dermal armor consisting of bony scutes covered with epidermal scales of corresponding form; the anus is longitudinal, as in the chelonians; the penis is single, and lodged in the cloaca; the teeth are distinctly socketed; the lungs are confined to the thorax; the heart is completely four-chambered, but the sortie arches communicate by the foramen Panizzae, so that venous and arterial blood commingle outside the heart; the spinal column is well ossified; the vertebrae are mostly procelous, as in all the existing species, amphiceolous or opisthocœlous in some extinct forms; the sacral vertebrae are reduced to two; the cervical bear free ribs; the ribs are bifurcated at their proximal ends; there is a series of so-called abdominal ribs disconnected from the vertebrae; and the skull is well ossified, with an interorbital septum, large alisphenoids and parotic processes, large fixed quadrates, ectopterygoids, completely bony tympanic cavities, rudimentary orbitosphenoids, if any, and no parietal foramen. The order ranges in time from the Oolitic strata to the present day, and contains all the huge saurians known as crocodiles, alligators, caymans, jacarés, gavials, etc. All the species are more or less aquatic, though none of the living ones is marine. The order has been divided into the five families *Alligatoridae*, *Crocodylidae*, *Gavialidae*, *Telesauridae*, and *Belodontidae*, the last two including only extinct forms. Other names of the order are *Loricata*, *Emydosauria*, and *Hydrosauria*. Other divisions of the order than those above given are: (1) by Owen, into three suborders, *Proœalia*, *Amphicoœlia*, and *Opisthocœlia*; and (2) by Huxley, likewise into three suborders, *Parasuchia*, *Mesonuchia*, and *Eusuchia*.

Longitudinal Vertical Section of Head of a Crocodile, showing many cranial peculiarities of *Crocodylia*.

En, Eustachian tube, dividing into *a*, an anterior, and *p*, a posterior branch; the two tympana communicating with the cavity of the mouth by three canals—a large one opening in the middle line, and two smaller lateral ones on the base of the skull behind the posterior nares; it is this lateral one which subdivides into *a* and *p*. *P*, pituitary fossa; *PN*, posterior nares, opening very far back; *Pr*, pterygoid; *Pa*, parietal; *Fr*, frontal; *OS*, orbitosphenoid (?); *AS*, alisphenoid; *BS*, basisphenoid; *BO*, basioccipital; *EO*, occipital; *SO*, supraoccipital; *Pro*, prootic; *EO*, eotic; *Op*, opisthotic, united with *EO*; *asc*, *psc*, anterior and posterior semicircular canals; *V*, *VIII*, exits of fifth and eighth nerves.

The family includes two genera: *Crocodylus*, represented by the crocodile of the Nile, *C. niloticus*, and other species; and *Mecistops*. See *cut* under *crocodile* and *Crocodylia*.

May I ne'er *crow* day! Scotch proverb. (Jamieson.)

crow¹ (krō), *n.* [crow¹, *v.*] The characteristic cry of the cock: sometimes applied to a similar cry of some other bird.

Many a time . . . a moor-fowl arose from the heath, and shot along the moor, uttering his bold *crow* of defiance.

Scott, Abbot, x.

crow² (krō), *n.* [crow, *craw*, *crowe*, *crawe*, < AS. *crāwe* = OS. *krāia* = D. *kraai* = MLG. *krā*, *krāge* = OHG. *chrāja*, *chrāwa*, *chrāra*, *chrā*, MHG. *krā*, *krāje*, G. *krāhe*, a crow, a raven; from the verb, AS. *crāwan*, etc., *crow* (orig. in a general sense). Cf. E. dial. *crake*, a crow, leel. *krāka*, a crow: see *crake*², *croak*, etc.] **1.** A general name including most birds of the genus *Corvus* and of the family *Corvidæ*; especially, one of the *Corvine*. See these three words. The larger kinds of crows are called *ravens*, especially those which have the throat-feathers lengthened, lanceolate, and discrete. The term, used absolutely, means in Great Britain the carrion-crow, *Corvus corone*, and in the United States the common American crow, *C. americanus*. The two species are so similar in all respects that they are only distinguished by slight technical characters. The plumage is jet-black, with a purplish and violet gloss or sheen, especially on the back, wings, and tail; the bill and feet are ebony-black; the base of the upper mandible is covered for a long distance with a bundle of antorse bristly feathers, filling each nasal fossa and hiding the nostrils. The eyes are bright and

intelligent, of a hazel-brown color. The feet are stout, with strong curved claws and scaly tarsal and toes. The tail is of moderate length, a little rounded or fan-shaped, of 12 broad plane feathers. The wings are lengthened and pointed, with 10 primaries, and when folded their tips fall nearly opposite the end of the tail. The length of these crows is 18 or 20 inches. Crows are among the most omnivorous of birds, eating almost everything from carrion to fruits. Some species, hence called *fish-crows*, are fond of fish and shell-fish, as mollusks and crustaceans. Crows usually nest in trees, where they build large bulky nests of sticks, and lay greenish eggs heavily spotted with dark colors, generally to the number of 4, 5, or 6. They are noted for their sagacity, and in populous countries become extremely wary and knowing birds, their instinct of self-preservation being developed to the highest degree by the incessant persecution to which they are subjected.

Opinions differ as to their being on the whole most beneficial or most injurious to the agriculturist, but they are generally classed as "vermin," and in some places a legal price is set upon their heads. Crows are eminently sociable birds, and however widely they may be dispersed in pairs in the breeding season, they flock at other times; and in winter, in many places in the United States, vast bands numbering hundreds of thousands assemble nightly to roost together, often flying 20 to 40 miles back to these *crow-roosts* at night after foraging over the country for food during the earlier hours of the day. The common American fish-crow is *C. ossifragus* or *C. maritimus*, an undersized species inhabiting southerly parts of the United States, especially coastwise, and feeding much on shell-fish. The northwestern fish-crow is *C. caurinus*, a similar though distinct species. The white-necked crow or raven is *C. cryptoleucus*, of western parts of the United States, in which the plumage of the neck beneath the black surface is snowy-white. A number of small crows resembling the fish-crow inhabit the West Indies, as *C. jamaicensis*. In some of these the face is partially naked, a character which is also conspicuous in the European raven, a kind of crow, *C. frugilegus*. The European daw, *C. monedula*, is another kind of crow. eastern United States: so called from its large size and dark color, which give it somewhat the appearance of a crow. The male is about 13 inches long and 17½ inches in extent of wings. The plumage is richly iridescent, with green, blue, violet, purple, and bronzy tints; the bill and feet are ebony-black; the iris is straw-yellow; the tail is somewhat boat-shaped. The female is blackish and quite lustrous, in this differing from some related species, and also a little smaller than the male. A variety has a perfectly brassy back and steel-blue head; it is sometimes distinguished as the *bronzed crow-blackbird*. The name is extended to the other species of the same genus. *Q. major* is a larger species of the southern United States, known as the *boat-tailed crow-blackbird* or *grackle*, and locally called *jackdaw*. The tail is much carinated, and the disproportion in size of the sexes is very great, the female being only about 13 inches long, while the male is 15½ to 17; the peculiar development of the tail is lacking in the female, and the color is plain grayish-brown, the male being richly iridescent black. A still larger species, the *fan-tailed crow-blackbird*, *Q. macurus*, also called *Texas grackle*, inhabits the Gulf States and Mexico; the male attains a length of 18 inches, while the female is much smaller. All these birds are gregarious, nest in trees and bushes, sometimes in holes, and lay 5 or 6 greenish eggs, clouded, veined, and scratched with various dark colors.

The obverse type of the crowns of Edward VI., James I., and Charles I. is the king on horseback, but from Charles II. to Victoria the obverse type is the head of the king or queen. The rare piece known as the Oxford crown was made, under Charles I., by the engraver Rawlins, and bears on the obverse a small view of Oxford, in addition to the ordinary type. The petition-crown is a pattern or trial-piece for a crown of Charles II., bearing the petition of its engraver, Thomas Simon, praying the king to compare the coin with the crown of the Dutch engraver John Roettier, by whom Simon had been superseded

to the crown or sovereign. They are placed under commissioners, and the revenue derived from them becomes part of the consolidated fund.

The additional allowances thus granted by Parliament to the Prince and Princess of Wales, and other members of the Royal Family, amount to an annual charge of £156,000; and when it is remembered that the Crown lands alone surrendered to Parliament yield an annual income of nearly £380,000, it will be evident that the charge upon the nation for the support of the dignity of Royalty is by no means extravagant, as interested persons would sometimes have us believe.

crusade¹ (krö-sād'), *n.* [Early mod. E. also *crusado, croisade, croisado, croisado*, earlier *cruciade*, late ME. *cruciade, cruciat* (being variously accom. to the ML, Sp., or F.); = F. *croisade* (after Pr.), OF. *croisic* (also in another form *croiseric*) = Pr. *croisada, crozada* = Sp. The earlier ME. word for 'crusade' was *croisery*: see *croisery*.] 1. A military expedition under the banner of the cross; specifically, one of the medieval expeditions undertaken by the Christians of Europe for the recovery of the Holy Land from the Mohammedans. The crusading spirit was aroused throughout Europe in 1095 by the preaching of the monk Peter the Hermit, who with Walter the Penniless set out in 1096 with an immense rabble, who were nearly all destroyed on the way. The first real crusade, under Godfrey of Bouillon, 1096-9, resulted in the capture of Jerusalem and the establishment of a Christian kingdom in the Holy Land; the second, 1147, preached by St. Bernard, was unsuccessful; the third, 1189-92, led by the princes Frederick Barbarossa of Germany, Richard the Lion-hearted of England, and Philip Augustus of France, failed to recover Jerusalem, which the Mussulmans had taken in 1187; the fourth, 1202-4, ended in the establishment of a Latin empire in Constantinople, under Count Baldwin of Flanders, one of its leaders; the fifth, 1228-9, under the emperor Frederick II., the sixth, 1248-50, under St. Louis (Louis IX. of France), and the seventh and last, 1270-71, also under St. Louis, were all unsuccessful. There were other expeditions called crusades, including one of boys, 1212, "the children's crusade," in which many thousands perished by shipwreck or were enslaved. The cost of the crusades and the loss of life in them were enormous, but they stimulated commerce and the interchange of ideas between the West and the East. The expeditions against the Albigenses under papal auspices, 1207-29, were also called crusades.

For the crusades preached through western Christendom, A. D. 1188, it was ordained that the English should wear a white cross; the French a red; the Flemish a green one. Quoted in *Rock's Church of our Fathers*, III. i. 446, note.

The *Crusades*, with all their drawbacks, were the trial feat of a new world, a reconstituted Christendom, striving after a better ideal than that of piracy and fraternal bloodshed. *Stubbs, Medieval and Modern Hist.*, p. 222.

Crustacea (krus-tā'shā), *n.* pl. [*NL.*, neut. pl. of *crustaceus*, having a crust: see *crustaceous*. Cf. L. *crustata*, shell-fish: see *crustate*.] A class of *Arthropoda*; one of the prime divisions of articulated animals with articulated legs, as

distinguished from *Insecta*, *Myriapoda*, and *Arachnida* respectively. They are mostly aquatic arthropods with (generally) two pairs of antennae and numerous thoracic as well as (usually) abdominal articulated appendages, and breathing by means of branchia. The body is covered with a hard chitinous test or crust, whence the name. It is segmented into head, thorax, and abdomen, the two former of which are more or less completely united into a cephalothorax, shielded with a continuous carapace; the abdomen is usually segmented and mobile, presenting the appearance of a tail. A typical segment or somite of the body consists, at least theoretically, of a dorsal portion or tergite of two pieces, a ventral portion or sternite, also of two pieces, an epimeron on each side above, and an episternum on each side below. The shell sends inward sundry hard processes or partitions called apodemata. The typical number of segments in the higher *Crustacea* is 21, actually or theoretically. The crustaceans shed their shells (exoskeletons), in some cases with extraordinary frequency, and they possess great reparatory powers in the reproduction of lost parts. Most of them pass through several larval stages, the best-marked of which are those of the forms called the *nauplius*, *zoëa*, and *megalopa*. The crustaceans include all kinds of crabs and lobsters, shrimps, prawns, crawfish, etc., among the higher forms; and among the lower, a great variety of creatures known as sand-hoppers, beach-fleas, wood-lice, fish-lice, barnacles, etc. Leading types, in more technical terms, are the thoracostracan, podophthalmic, or stalk-eyed crustaceans, as crabs and crawfish; the edriophthalmous or sessile-eyed crustaceans, as lepidopods, amphipods, and isopods (all the foregoing being sometimes grouped together as malacostracan crustaceans); the entomostracan crustaceans, as the copepoda, ostracodes, cladocerans, phyllopods, etc., the trilobites and their related forms being often brought under this division; the epizoans, ichtyophthirians, or fish-lice; and finally, the cirripeds. Great as is the difference between extremes in any of these forms, they are closely related by connecting forms, and naturalists are by no means agreed upon the formal division of the class. The older divisions which have been made are now mostly superseded, and even the modern ones are seldom exactly conforming. A series of subclasses sometimes now adopted is: (1) *Cirripedia* or *Pectostraca*, with three or four orders; (2) *Epizoa* or *Ichthyophthirica*; (3) *Entomostraca*, with such orders as *Copepoda*, *Ostracoda*, *Cladocera*, *Phyllopoda*, *Xiphura*, *Trilobita*, *Eurypterida*; (4) *Edriophthalma*, with *Lemnodipoda*, *Amphipoda*, and *Isopoda*; (5) *Podophthalma*, with *Stomatopoda* and *Decapoda*; to which some add (6) *Podosomata*, often considered to be arachnidians. The fourth and fifth of these are often united as one subclass, *Malacostraca*. The trilobites with the eurypterygians and king-crabs sometimes constitute one prime division called *Gigantostroaca*. Haeckel uses *Carides* as a substitute for *Crustacea*.

[cap.] The Southern Cross, the most celebrated constellation of the southern heavens. It was erected into a constellation by Royer in 1679, but was often spoken of as a cross before; there even seems to be an obscure allusion to it in Dante. It is situated south of the western part of Centaurus, east of the keel of Argus. It is a small constellation of four chief stars, arranged in the form of a cross. Its brightest star, the southernmost, is of about the first magnitude; the eastern, half a magnitude fainter; the northern, of about the second magnitude; and the western, of the third magnitude and faint. The constellation owes its striking effect to its compression, for it subtends only about 6° from north to south and still less from east to west. It looks more like a kite than a cross. All four stars are white except the northernmost, which is of a clear orange-color. It contains a fifth star of the fourth magnitude, which is very red.

The name remains in general use, and the group is further characterized by the absence of a seed containing an embryo. The organs and methods of reproduction vary greatly, in some cases being closely analogous to those of phenogamous plants, while in the lowest no sexual character whatever is distinguishable. As improvements in the microscope have made possible a more thorough study of the *Cryptogamia*, their classification has been gradually modified and perfected, but it still remains to some extent unsettled, especially in regard to the lower groups. A division into *higher* and *lower* *cryptogams* is often made, corresponding to the aëthogamous and amphigamous classes of De Candolle's arrangement, otherwise known as acrogens and thallogens. The first group are either vascular (including the *Filices*, *Equisetaceæ*, and their allies, also called *Pteridophyta*) or cellular (including the *Hepaticæ* and *Musci*, unitedly called *Bryophyta*). Sp. *crystal* = Pg. *crystal* = It. *crystallo* = AS. *cristalla* = D. *kristal* = OHG. *chrystallā*, MHG. *kristalle*, fem., *kristall*, masc., G. *kristall*, *kristall*, masc., = Dan. *krystal* = Sw. *kristall*, < L. *crystallum*, ice, crystal, < Gr. κρυστάλλος, clear ice, ice, also rock-crystal (so called from its resemblance to ice, of which it was supposed to be a modified and permanent form), < κρυσταίνειν, freeze, < κρύος, cold, frost.] I. n. 1. In chem. and mineral., a body which, by the operation of molecular attraction, has assumed a definite internal structure with the form of a regular solid inclosed by a certain number of plane surfaces arranged according to the laws of symmetry. The internal structure is exhibited in the cleavage, in the behavior of sections in polarized light, etc. The external form is discussed under *crystallography* (which see). Crystals are obtained in the laboratory either by fusing substances by heat and allowing them gradually to cool, or by dissolving them in a fluid and then abstracting the latter by slow evaporation; also by the direct condensation of a vapor produced by sublimation, as in the case of arsenious acid, in the same way that snow-crystals are formed directly from water-vapor in the upper atmosphere. The name was first applied to the transparent varieties of quartz, specifically called *rock-crystal*.

There was a sea of glass like unto *crystal*. Rev. iv. 6.

The term *crystal* is now applied to all symmetrical solid shape assumed spontaneously by lifeless matter.

Huxley, *Physiography*, p. 59.

2. Glass. (a) Glass of a high degree of transparency and freedom from color. It is heavier than ordinary glass, because containing much oxid of lead. (b) Fine glass used for table-vessels or other table-service, or for ornamental pieces. The term is sometimes used as synonymous with *cut glass*. (c) The glass cover of a watch-case.

See *pseudomorph*.—**Replaced crystal**, a crystal having one plane or more in the place of each of its edges or angles.—**Rock-crystal**, or **mountain crystal**, a general name for all the transparent crystals of quartz, particularly of limpid or colorless quartz. From their brilliancy such crystals are often popularly called *diamonds*, as *Lake George diamonds*, *Bristol diamonds*, etc.—**Twin crystal**. See *twin*.

crystallization (kris'ta-li-zā'shən), n. [= F. *crystallisation* = Sp. *crystalización* = Pg. *crystalização* = It. *crystalizzazione* = D. *kristallisatie*; as *crystallize* + *-ation*.] 1. The process by which the molecules of a substance which is in the state of a liquid (or vapor) unite in regular (crystalline) form when it solidifies by cooling or evaporation. If the process is slow and undisturbed, the molecules assume a regular arrangement, each substance taking a determinate form according to its natural laws; but if the process is rapid or disturbed, the external form may be more or less irregular. An amorphous solid body may also undergo partial crystallization by a molecular rearrangement, giving it a more or less complete crystalline structure, as, for instance, in the iron of a railroad-bridge after long use. See *crystallography*.

2. The mass or body formed by the process of crystallizing.

Also spelled *crystallisation*.

Alternatè crystallization, a species of crystallization which takes place when several crystallizable substances having little affinity for one another are present in the same solution. The substance which is largest in quantity and least soluble crystallizes first, in part; the least soluble substance next in quantity then begins to crystallize; and thus different substances, as salts, are often deposited in successive layers from the same solution.—**Water of crystallization**, water which is held by certain salts as a part of their crystalline structure, but is not inherent in the molecule. Thus, common sodium carbonate, when it crystallizes from a solution, contains for each molecule of sodium carbonate ten molecules of water. This is so weakly held that it escapes as vapor in dry air at ordinary temperatures. The crystalline form of the salt often depends on the number of molecules of water which the crystals contain. Water of crystallization differs from combined water in that it does not belong to the molecular structure, but only to the crystalline structure, of the substance.

The science of the process of crystallization, and of the forms and structure of crystals. The following are the generally adopted systems of crystallization, based upon the degree of symmetry which characterizes the different forms, but defined according to the length and inclination of the assumed axes: (a) the *isometric*, characterized by three rectangular axes, all of equal length; (b) the *tetragonal*, by three rectangular axes, two of which are of equal length; (c) the *hexagonal* (and *rhomboidal*), by four axes, three of equal length, in the same plane, and inclined to one another at an angle

of 60°, the fourth of different length, and at right angles to the plane of the other three; (d) the *orthorhombic*, by three rectangular axes of unequal length; (e) the *monoclinic*, by three axes, two at right angles to each other, and the third perpendicular to one and oblique to the other; and (f) the *triclinic*, by three axes, all oblique to one another. (See these names.) Instead of *isometric*, the terms *monometric, cubic, and regular* are sometimes used; instead of *tetragonal, dimetric*; instead of *orthorhombic, trimetric or rhombic*; instead of *monoclinic, monosymmetric or oblique*; and instead of *triclinic, asymmetric or anorthic*. The isometric, tetragonal, and orthorhombic systems are sometimes spoken of collectively as *orthometric*, and the monoclinic and triclinic as *clinometric*; similarly, the tetragonal and hexagonal systems have been called *isodimetric*. The study of crystallography is of great importance to the chemist and mineralogist, as the nature of many substances may be ascertained from an inspection of the forms of their crystals.

They are exceptional among the *hystriocomorphic* animals in not having four back teeth above and below on each side. In *Ctenodactylus* the molars are three in each half jaw above and below, there being no premolars; and in *Pectinator*, the only other genus, these teeth are minute. The *Ctenodactylinae* have some relationship with the *jerboas*, though totally different in appearance. They are confined to Africa.

Putte thou elde clothes . . . vndur the *cubit* of thin hendis [translation of Latin *sub cubito*].
Wyclif, Jer. xxxviii. 12 (Purv.)

(b) The inner bone of the forearm; the ulna. — **2.** A linear unit derived from the length of the forearm. The natural cubit used for measuring cloth was probably originally the length from the end of the thumb-nail to the elbow, though no cubit so short is known. The royal Egyptian cubit is, of all units of measure or weight, that one whose use can be traced back in history the furthest; for it was employed in the construction of the pyramids of Gizeh, perhaps 3500 B. C. From a number of Egyptian measuring-sticks found in the tombs, this cubit is ascertained to be equal to 20.64 English inches, or 524 millimeters. It was divided into 280 palm, instead of six as the ordinary cubit was; and this was probably owing to measurements along walls with the forearm having been made by placing the hand behind the elbow and leaving it on the wall until the arm was laid down again. The Egyptian and Roman are the only ancient cubits of importance whose lengths are undisputed. The Roman cubit was 1½ Roman feet, or 17.4 English inches. Two cubits are mentioned in the Bible, for Ezekiel speaks of a cubit which is a cubit and a hand-breadth. The shorter of these cubits was probably that which in Deuteronomy is called the cubit of a man; the longer one, that which in Chronicles is called the cubit after the first measure — that is, the most ancient cubit. Julian of Ascalon speaks of two cubits in the ratio of 23 to 25. But we have no accurate knowledge of the lengths of the Hebrew cubits, since the cubit of the temple is estimated variously by high authorities, as from 19 to 26 inches. There are many cubits, ancient and modern, of widely different value.

And see schulle undirstonde, that the Cros of oure Lord was eyght *Cubytes* long, and the overthwart piece was of lengthe thre *Cubytes* and an half.

In the thirteenth century it consisted of a roundel, slightly hollowed in the form of a cup, and held over the hauberk or brigaine by a strap passing round the elbow-joint; later it became more conical, and in the fourteenth century another plate was added, covering the side of the elbow-joint. When the complete brassart was introduced, toward the close of the fourteenth century, the *cubitière* formed a part of this, and was regularly articulated; but the old cup-shaped form or some modification of it was retained by those who could not afford the expense of the brassart of plate. A similar imitation occurs also in *coo*, *cook*², *cock*¹, *caw*, etc. (see these words). The forms, being imitative, do not conform closely to the rules of historical development. In early superstitions the cuckoo was regarded as of evil omen, and enters into various imprecations and proverbs as an embodiment of the devil. It was also a term of reproach or contempt equivalent to *fool* (cf. *gawk*, in similar use), and with reference to its habit of laying its eggs in other birds' nests is the subject of endless allusion in early literature: see *cuckold*¹.] 1. A bird of the family *Cuculidae*, and especially of the subfamily *Cuculinae* or genus *Cuculus*: so called from its characteristic note. bill, and ashy plumage varied with black and white. It is notorious for its parasitism, having the habit common to many birds of the family of depositing its eggs in the nests of other birds, chiefly smaller than itself, and causing its young to be reared by the foster-parents—a condition generally entailing the destruction of their own progeny. The remarkable cries which have given the bird imitative names in many languages are the love-notes, uttered only during the mating season. The species of cuckoo are very numerous, and are found in most parts of the world; they are not all parasitic. There are several subfamilies of *Cuculidae*, and many genera. (See *Cuculidae*.) The American or tree-cuckoos are arboreal, not parasitic, and are confined to America; they are also called hook-billed cuckoo, a term not of special pertinence. The ground-cuckoo are American birds of terrestrial habits. The crested cuckoo are old-world forms, as are also the coucals, lark-heeled or spur-heeled cuckoos, also called pheasant-cuckoo.

The feet are permanently zygodactyl by reversion of the fourth toe, yet the birds are not of scansorial habits. The bill is moderate, generally curved, with a deflected tip and no cere; the palate is desmognathous; the legs are homisognathous; the carotids are two in number; the oil-gland is nude; and caeca are present. It is a large and important family, with about 200 species, showing various minor modifications of structure corresponding in a measure with faunal areas; it is consequently divided into a number of subfamilies. The *Couineæ* are a peculiar Madagascan type. The *Phenicoptæneæ* are confined to the old world, as are the *Centropodinae* or spur-heeled cuckoos, and the *Cuculinae* or typical cuckoos. (See cut under *cuckoo*.) America has three types, those of the *Coccyzinae* or tree-cuckoos, the *Sauvotherinae* or ground-cuckoos, and the *Crotophaginae* or gregarious cuckoos. (See cuts under *ani*, *Coccyzus*, and *chaparal-cuck*.) The birds of the genus *Indicator*, sometimes included in the family, are now usually elevated to the rank of a distinct family. In their economy the *Cuculidæ* are noted for their parasitism, which runs through many, though not all, of the genera composing the family.

2. (a) A distinct terminal part of a sleeve at the wrist, intended for embellishment. The cuff was made originally by turning back the sleeve itself and showing either the same material as that of the sleeve or a different material used as a lining. In the fifteenth century a prominent part of the dress was the large cuff, which could be turned down so as to cover the hand to the finger-tips, and when turned back reached nearly to the elbow. In modern times the coat-sleeve has been sometimes made with a cuff which can be turned down over the hand, though not intended to be so used, and sometimes with a semblance of a cuff, indicated by braid and buttons, or by a facing of velvet or other material, or merely by a line or lines of stitching around the sleeve. (b) A band of linen, lace, or the like, taking the place of, and covering a part of the sleeve in the same manner as, the turned-up cuff. In the seventeenth century such cuffs, worn by ladies, were often extremely rich, of expensive lace, and reached nearly to the elbow. Plain linen cuffs were also worn about 1640, and were especially affected by the Puritans in England. When the plain linen wristband worn attached to the shirt by men first came into use, in the early part of the nineteenth century, it was commonly turned back over the sleeve, and was a true cuff. We ought to blame the culture, not the soil.

2. The act of promoting growth in animals or plants, but especially in the latter; specifically, the process of raising plants with a view to the production of improved varieties.

These bud variations . . . occur rarely under nature, but they are far from rare under *culture*. *Darwin*, Origin of Species, i.

Hence—3. In *bacteriology*: (a) The propagation of bacteria or other microscopic organisms by the introduction of the germs into suitably prepared fluids or other media, or of parasitic fungi upon living plants. Also called *cultivation*.

The only thing to be done now was to take advantage of what had previously been learned as to the attenuation of virus, and endeavor, through successive *cultures*, to progressively lessen the harmfulness of the rabid poison. *Sci. Amer. Supp.*, p. 8692.

(b) The product of such culture.

This bacillus [of typhoid fever] is difficult to stain in tissue, while pure cultures stain readily with the usual dyes. *Buck's Handbook of Med. Sciences*, IV. 765.

4. The systematic improvement and refinement of the mind, especially of one's own.

[Not common before the nineteenth century, except with strong consciousness of the metaphor involved, though used in Latin by Cicero.]

Rather to the pomp and ostentation of their wit, than to the *culture* and profit of their minds. *Sir T. More*, Works, p. 14.

The *culture* and manurance of minds in youth hath such a forcible (though unseen) operation as hardly any length of time or contention of labour can countervail it afterwards. *Bacon*, Advancement of Learning (Original [English ed.], Works, III. 415).

O Lord, if thou suffer not thy servant, that we may pray before thee, and thou give us seed unto our heart, and *culture* to our understanding, that there may come fruit of it, how shall each man live that is corrupt, who beareth the place of a man? *2 Esd.* viii. 6.

5. The result of mental cultivation, or the state of being cultivated; refinement or enlightenment; learning and taste; in a broad sense, civilization: as, a man of *culture*.

Culture or Civilization, taken in its wide ethnographic sense, is that complex whole which includes knowledge, belief, art, morals, law, custom, and any other capabilities and habits acquired by man as a member of society. *E. B. Tylor*, Prim. Culture, i. 1.

Culture in its widest sense is, I take it, thorough acquaintance with all the old and new results of intellectual activity in all departments of knowledge, so far as they conduce to welfare, to correct living, and to rational conduct. *W. K. Brooks*, Law of Heredity, p. 272.

Gelatin culture, a growth of bacteria in a medium made of the consistence of jelly by means of gelatin.—**Pure culture**, in *bacteriology*, a growth of one kind of bacteria free from admixture of other varieties.—**Solid culture**, a culture of bacteria, etc., for which the medium is a solid at ordinary temperature, usually gelatin or a preparation, such as agar-agar, made from algae.—**Test-tube culture**, a growth of bacteria in a test-tube.—Syn. 4-6. *Refinement, Cultivation, Culture*. Each of these words may represent a process or the result of that process. Only *refinement* can, when unqualified, represent a process or result carried too far. *Refinement* is properly most negative, representing a freeing from what is gross, coarse, rude, and the like, or a bringing of one out of a similar condition in which he is supposed to have been at the start. *Cultivation* and *culture* represent the person or the better part of him as made to grow by long-continued and thorough work. *Refinement* and *cultivation*, as thus representing the more negative and the more positive aspects of the improvement of man, were much more common until within thirty years; since then *culture* has largely supplanted *cultivation*: this change, coming when great attention was concentrating about the subject of the development of all the departments of the nature of man, produced a great enlargement of the definition of *culture*, for a time the improvement and gratification of taste being magnified in undue proportion by some, and by others the mere acquisition of knowledge. The word is now applied to the improvement of the whole man, bodily, mentally, and spiritually, although bodily training is not prominent unless specially mentioned; the moral and the spiritual are jealously included. *Culture* may be used of the state of society as well as of the man; *refinement* and *cultivation* refer primarily to the state of the individual. As referring to either, *culture* in its broadest sense may be called the highest phase of civilization.

What do we mean by this fine word *Culture*, so much in vogue at present? What the Greeks naturally expressed by their *paideia*, the Romans by *humanitas*, we less happily try to express by the more artificial word *Culture*. . . . When applied to the human being, it means, I suppose, the "educing or drawing forth [of] all that is potentially in a man," the training [of] all the energies and capacities of his being to the highest pitch, and directing them to their true ends. *Shairp*, Culture and Religion, i.

= *Syn. 4*. *Cunning, Artful, Sly, Subtle, Shrewd, Tricky, Adroit, Wily, Crafty, Intriguing, sharp, foxy.* All these words suggest something underhand or deceptive. *Cunning*, literally knowing, and especially knowing how, now implies a disposition to compass one's ends by concealment; hence we speak of a fox-like *cunning*. *Artful* indicates greater ingenuity and ability, the latter, however, being of a low kind. *Sly* is the same as *cunning*, except that it is more vulgar and implies less ability. ("A col-fox, full of sleigh iniquité." *Chaucer, Nun's Priest's Tale, l. 395.*) ("Envy works in a sly, imperceptible manner." *Watts.*) *Subtle* implies concealment, like *cunning*, but also a marked ability and the power to work out one's plans without being suspected; hence, while *cunning* is applicable to brutes, *subtle* is too high a word for that, except by figurative use. The rabbit is *cunning* enough to hide from the dog; Mephistopheles is *subtle*. (For the favorable meanings of *subtle*, see *astute*. For the good senses of *shrewd*, see *acute*.) In its unfavorable aspects *shrewd* implies a penetration and judgment that are somewhat narrow and worldly-wise, too much so to deserve the name of sagacity or wisdom. (See *astute*.) *Tricky* is especially a word of action: it expresses the character and conduct of one who gets the confidence of others only to abuse it by acts of selfishness, especially cheating. *Adroit*, in a bad sense, expresses a ready and skilful use of trickery, or facility in performing and escaping detection of reprehensible acts. (See *adroit*.) *Wily* is appropriate where a person is viewed as an opponent in real or figurative warfare, against whom wiles or stratagems are employed: a *wily* adversary is one who is full of such devices; a *wily* politician is one who is notably given to advancing party interests by leading the opposite side to commit blunders, etc. A *crafty* man has less ability than a *subtle* man, and works more by deception or knavery than the *shrewd* man; he is more active than the *cunning* man, and more steadily active than the *sly* man; he is on the moral level of the *trickish* man. *Intriguing* is applied where the plots are secret arrangements made with others, perhaps against a third party, and especially of a complicated character.

Controller of the Currency. See *controller*, 2.—**Decimal currency**, a system of money the divisions or denominations of which proceed from its lowest unit of reckoning by ten or its multiples, or aliquot parts thereof, as the cent, dime, dollar, quarter-dollar, etc., of the United States and Canada.—**Fractional currency**, coins or paper money of a smaller denomination than the monetary unit; in the United States, half-dollars, quarters, dimes, and 5-cent, 3-cent, 2-cent, and 1-cent pieces. Fractional currency in paper has been largely used in several European countries, and is a part of the monetary system of Japan. Fractional notes have been used at different times in the United States, especially during the financial panic of 1837–38, and during and after the civil war of 1861–65, when specie was withdrawn from circulation. The former received the name of *shinplasters*. (See *shinplaster*.) On March 17th, 1862, Congress authorized an issue of circulating notes called *postage currency*, imitating in style the stamps that had previously been used at great inconvenience, in denominations of 5, 10, 25, and 50 cents. These were superseded by the fractional currency authorized March 3d, 1863, in denominations of 3, 5, 15, 25, and 50 cents. The issue of fractional notes was suspended by act of April 17th, 1876; but its renewal has since been proposed for convenience in remittance of small sums.—**Metallic currency**, the gold, silver, and copper in circulation as money.—**National Currency Acts**, statutes of the United States of 1863, 1864, and 1865, providing for a general and uniform bank-note currency guaranteed by the United States and secured by national bonds deposited in the Treasury.—**Paper currency**, notes issued by a government or by banks as a substitute for money, or as a representative of money. The paper currency of the United States is of three kinds: (1) notes issued by the government and called *demand treasury notes*, or more generally *legal-tenders*; (2) notes issued by national banks; and (3) certificates issued by the government upon either gold or silver. The smallest denomination of the first is \$20, and of the last \$1.—**Postage currency**. See *fractional currency*, above.—**The currency principle**, a phrase first employed in English banking to express the mode of issuing notes by the Bank of England. An amount fixed by law is issued, based on an equal amount of securities, mostly government obligations; and all notes issued in excess of that amount, which is called "the fixed issue," are based on an equal amount of specie.

Cursor (kèr'si-tór), *n. pl.* [*NL., pl. of ML. cursor, a runner: see cursor.*] In Macgillivray's system of classification, an order of birds, the runners, exemplified by the plovers.

cursive (kèr'siv), *a. and n.* [= *F. cursif* = *Sp. Pg. cursivo* = *It. corsivo*, < *ML. cursivus*, running (of writing), < *L. cursus*, a running, a course, < *currere*, run: see *current*¹.] **I. a.** Running; flowing, as writing or manuscript in which the letters are joined one to another, and are formed rapidly without raising the pen, pencil, or stylus; specifically, in *paleography*, modified from the capital or uncial form, so as to assume a form analogous to that used in modern running hand: as, the *cursive* style; *cursive* letters; *cursive* manuscripts. Greek cursive writing is found in papyri dating back to about 160 B.C., at first very similar to the lapidary and uncial characters of the same period, but gradually becoming more rounded in form, and negligent in style. The epithet *cursive* is, however, most frequently applied to the later cursive or minuscule writing from the ninth century on. (See *minuscule*.) The beginning of a Latin cursive character is seen in some waxed tablets discovered in 1875 in the house of L. Cæcilius Juncundus at Pompeii. Forms similar to these also occur in the dipinti and graffiti (characters painted on or incised in walls, earthenware, etc.) of the same place or period. The ancient Latin cursive character known to us in man uscripts from the fourth century on is, however, considerably different from this. In medieval manuscripts the cursive hand was employed from the Merovingian epoch, often in combination with the other contemporary styles; but from the ninth century it was replaced for all careful work by the so-called Caroline and Gothic characters, and continued in use up to the invention of printing only in degenerated form and for writings of small importance or hasty execution. (See *manuscript*.)

In the earliest examples of *cursive* writing we find the uncial character in use, and, as has been already remarked, many of the specimens fluctuate between the more formal or act book-hand and the *cursive*.

Encyc. Brit., XVIII. 149.

II. n. 1. A cursive letter or character: as, a manuscript written in *cursive*s.

curve (kêrv), *a.* and *n.* [In earlier use *curb*, < ME. *courbe*, < OF. *courbe*, *corbe* (see *curb*), F. *courbe* = Pr. *corb* = Sp. Pg. A *curve* line is that which is neither a straight line nor composed of straight lines. *Ogilvie*.

II. n. 1. A continuous bending; a flexure without angles; usually, as a concrete noun, a one-way geometrical locus which may be conceived as described by a point moving along a line round which as axis turns a plane, while the line rotates in the plane round the point. The curve is at the same time the envelop of the plane and of the line. Geometers understand a curve as something capable of being defined by an equation or equations, or otherwise described in general terms. It may thus have nodes, cusps, and other singularities, but must not be broken in a way which cannot be precisely defined without the use of special numbers. Curves are often employed in physics and statistics to represent graphically the changes in value of certain physical or statistical quantities: as, the energy curve of the solar spectrum; the isothermal line or curve; the curve of population.

An *in curve* is one that deflects from the straight line toward the batter; an *out curve*, away from the batter. A *drop* deflects downward, and a *rise* or *up curve* upward. — **Adiabatic curve.** See *adiabatic*. — **Algebraic curve,** a curve whose equations in linear coordinates contain only algebraic functions of the coordinates. — **Anelastic curves, anallagmatic curves.** See the adjectives. — **Anticlinal and synclinal curves, in geol.,** terms applied to the elevations and depressions of undulating surfaces of strata. A cubic curve in a plane is one which is cut by every line in the plane in three points, real or imagi-

nary. Such curves are of three genera: nodal cubics, which have either a crunode or an acnode; cuspid cubics, which have a cusp; and non-singular cubics, which are bicursal, though one branch may be imaginary. — **Curve coordinates.** See *coördinate*. — **Curve of beauty,** a gentle curve of double or contrary flexure, in which it has been sought to trace the foundation of all beauty of form. The form of the curve traced out by the point of light depends upon the difference of pitch between the two forks, and also upon the difference of phase. — **Loxodromic curve.** See *loxodromic*. — **Magnetic curves.** See *magnetic*. — **Mechanical curve,** a curve of such a nature that the relation between the abscissa and the ordinate cannot be expressed by an algebraic equation. Such curves are now generally called *transcendental curves*: opposed to *algebraic curve*. — **Order of an algebraic curve,** the number of points, real or imaginary, in which it cuts every plane (or every line in that plane). — **Organic description of curves, in geom.,** the description of curves on a plane by means of instruments. — **Periodic curve,** a curve which represents a periodic function. — **Plane curve,** a curve lying in a plane. — **Quartic curve,** a curve of the fourth order. — **Radical curve,** a spiral having several branches through the origin. — **Range curve,** a curve employed to determine the approximate ranges for different angles of elevation of a projectile fired from a given piece with a given charge of powder. G. kuttelfisch, both prob. of E. origin.] A cephalopod; specifically, a cephalopod of the genus *Sepia* and family *Sepiidae*; a dibranchiate

cephalopodous mollusk, with a depressed body, inclosed in a sac. The shorter arms or feet, eight in number, covered with four rows of raised disks or suckers, are arranged around the mouth, and from the midst of them extend two long tentacles, also furnished with disks. These members the animal uses in walking, for attaching itself to objects, and for seizing its prey. A tube or funnel exists below the head and leads from the gills, through which the water admitted to these organs is expelled; and the creature, by ejecting the water with force, can dart backward with amazing velocity. In a sac on the back of the mantle there is a light, porous, calcareous shell formed of thin plates; this is the cuttlebone or sepiost, corresponding to the calamary or pen of the squids. (See *calamary*.) The cuttlefish has the power of ejecting a black, ink-like fluid, the sepia of artists (see *sepia*), from a bag or sac, so as to darken the water and conceal itself from pursuit. From this usage the term *cuttlefish* is extended not only to all the forms of *Sepiidae* and related decapod cephalopoda, but also to the octopod members of the same class. When the octopoda are called cuttlefishes, the decapods are commonly distinguished as *squids*. The two figures illustrate the two principal types. bryo of certain compound ascidians, as of those of the genus *Pyrosoma*, serving only to found a colony by gemmation. See the extract.

The result [of the process of yolk-division] is the formation of an elongated flattened blastoderm, which occupies one pole of the egg, and is converted into what I termed the *cyathozooid*, which is . . . a sort of rudimentary ascidian. From this, a prolongation or stolon is given off, which becomes divided by lateral constrictions into four portions, each of which gives rise to a complete ascidozooid. As these increase in size, they coil themselves round the *cyathozooid*, with their oral openings outwards and their cloacal openings inwards, and thus lay the foundation of a new ascidiarium. The *cyathozooid* eventually disappears, and its place is occupied by the central cloacal cavity. *Huxley*, *Anat. Invert.*, p. 523.

Carnot's cycle, the succession of operations undergone by the substance in the interior of Carnot's imaginary engine; namely, the piston is first forced down without the escape of any heat by conduction; next, heat is communicated to the contents of the cylinder, but pressure is

removed from the piston, so that there is no change of temperature; third, the conduction of heat being stopped, further pressure is removed, so that the piston rises still further; finally, heat is removed from the contents of the cylinder, but pressure is put on to the piston so as to preserve the temperature unchanged until the body in the cylinder is brought back to its original condition; or all these operations are reversed.—**Chinese cycle.** See *sexagenary cycle*.—**Cycle of indiction,** an arbitrary period of 15 years used in Roman and ecclesiastical history. The year A. D. 313 is taken as the first year of the first cycle.—**Cycle of the saros, or Chaldean cycle,** a period of very nearly 6,585 days, in which eclipses recur nearly in the same way.—**Hebdomadal or heptal cycle,** a period of seven days or years, which was supposed, either in its multiple or submultiple, to govern many phenomena of animal life. *Dunlison*.—**Metonic cycle,** the lunar-solar cycle, established by the Greek astronomer Meton, the first year of the first cycle beginning 432 B. C., June 27. It contained 19 years, of which 12 consisted of 12 lunations, and the other 7—that is to say, the 3d, 6th, 8th, 11th, 14th, 16th, and 19th—consisted of 13 lunations. At the end of the cycle the sun was in about the same position as at the beginning; in fact, 19 tropical years are 6,939.60 days, while 235 lunations are 6,939.69 days, so that there is a difference of only about 2 hours between the two. This cycle is used in ecclesiastical computations in determining the date of Easter. In the northern hemisphere the cyclonic motion is usually counter-clockwise, and in the southern hemisphere it is clockwise. Cyclones generally develop into cyclonic storms. See *anticyclone*.

Cyclones occur at all hours of the day and night, whereas whirlwinds and tornadoes show a diurnal period as distinctly marked as any in meteorology. Finally, *cyclones* take place under conditions which involve unequal atmospheric pressures or densities at the same heights of the atmosphere, due to inequalities in the geographical distribution of temperature and humidity; but whirlwinds occur where for the time the air is unusually warm or moist, and hence, consequently, temperature and humidity diminish with height at an abnormally rapid rate. *Cyclones* are thus phenomena resulting from a disturbance of the equilibrium of the atmosphere considered horizontally, but whirlwinds and tornadoes have their origin in a vertical disturbance of atmospheric equilibrium.

3. Popularly, a tornado (such as occur in the Western States), or any destructive storm. See *tornado*, *waterspout*, and *whirlwind*. [U. S.]

(*c.*) Vast; gigantic: applied to an early style of masonry, sometimes imitated in later ages, constructed of stones either unwhewn or more or less irregularly shaped and fitted together, usually polygonal, but in some more recent examples approaching regular horizontal courses, and often presenting joints of very perfect workmanship. Such masonry was fabled to be the work of the Cyclopes. It is remarkable for the immense size of the stones commonly employed, and was most frequently used for the walls of cities and fortresses.

The walls of Tyrinus, near Nauplia, in Greece, mentioned by Homer, are a good specimen of *Cyclopean* masonry. The remains of these walls

II. n. 1. [*cap.*] One of a sect of Greek philosophers founded by Antisthenes of Athens (born about 444 B. C.), who sought to develop the ethical teachings of Socrates, whose pupil he was. The chief doctrines of the Cynics were that virtue is the only good, that the essence of virtue is self-control, and that pleasure is an evil if sought for its own sake. They were accordingly characterized by an ostentatious contempt of riches, arts, science, and amusements. The most famous Cynic was Diogenes of Sinope, a pupil of Antisthenes, who carried the doctrines of the school to an extreme and ridiculous asceticism, and is improbably said to have slept in a tub which he carried about with him. 2. A person of a cynical temper; a sneering faultfinder.

By means of their ovipositors they puncture plants, depositing their eggs along it, is believed, with some irritant fluid which produces tumors commonly called gall or nut-galls. Besides the true gall-flies, the *Cynipidae* include certain lequillinous and parasitic forms. The anterior wings lack a complete costal nerve and stigma (except in *Ibalia*); the abdomen is generally compressed-ovate or ovate, rarely clubiform; and the ovipositor is subspiral. Nearly 400 European cynipids have been described, and about 200 from North America, many of which latter are known only by their galls. The family is divided into five subfamilies, *Cynipinae*, *Ibalinae*, *Inquilinae*, *Allotriinae*, and *Figitinae*. It was called by Leach *Diplolepidae*. The name of the family is also written *Cynipidae*, *Cynipites*, *Cyniphidae*, and *Cynipisae*. A genus of baboons, of the family *Cynopithecidae*. It formerly included all those baboons to which the term "dog-faced"

was applied, from the extremely prognathous jaws, giving a canine physiognomy; but it is now restricted to exclude the drill, mandrill, etc. The common baboon is *C. babuin*, inhabiting northerly parts of Africa, where it lives in troops in rocky places. In this species the tail is about one third the whole length. Closely related are the chacma, *C. porcarius*, of South Africa, and the sphinx baboon, *C. sphinx*, of West Africa. The hebe or hamadryad, *C. hamadryas*, of Abyssinia, differs in having long hair on the head and shoulders, and a shorter tail, only about one fourth of the total length. *Cynoccephalus* is nearly a synonym of *Papio*, of prior date.

It was divided by Blyth into *Digitigrada*, *Subplantigrada*, *Plantigrada*, and *Pinnigrada*. It is the larva of the *Tenia solium*, found in meaty pork, and developing in man into the tapeworm. It has but one tenia-head in the cyst, and the term *cysticerous* is retained as a convenient designation of such larvae. Thus, the cysticerous of the ox becomes in man *Tenia medicamentata*; the *Cysticerous pisiformis* of the rabbit becomes *Tenia serrata* of the dog, wolf, or fox; the *Cysticerous fasciolaris* of the rat and mouse develops in the cat as *Tenia crassicauda*. 1. An emperor; a king; specifically, the common title of the Emperor of Russia. In old Russian annals the Mongol princes of Russia from the twelfth century are called czars; the first independent Russian prince to assume the title was Ivan IV., the Terrible, who in 1547 was crowned Czar of Moscow. The title *czar*, though historically equivalent, like its original *Cæsar*, to emperor, was not recognized as involving imperial rank at the time of its assumption by Ivan; and Peter the Great's assumption of such rank under the title of *emperor*, in addition to that of *czar*, was long contested by other powers.

2. An article of dress, apparently a cravat, in use in the early part of the eighteenth century: probably named in compliment to Peter the Great, who visited England in 1698.

Another Russ. form is *tsesarevichū*, > G. *Cäsarévitch, F. Césarévitch, E. Césarevitch* or *Cesarevitch*.] A Russian prince (imperial): formerly applied to any son of the Emperor of Russia, now specifically to the eldest son. 1. The fourth letter and third consonant in the English alphabet: the corresponding character has the same position and the same value also in the Latin, Greek, and Phœnician alphabets, from which it comes to us. (See A.) The scheme of corresponding characters (compare the preceding letters) is as follows:

The sound which the character has from the beginning being used to represent is the sonant or voiced mute (or check, stop, contact sound) corresponding to *t* as *surd* or *breathed*, and to *n* as nasal. (See the terms used and the letters referred to.) It is generally called a "dental," but with only a conventional propriety, since the teeth bear no part in its production. It involves a closure of the tip of the tongue against the roof of the mouth at a point near to, or even touching, the upper front teeth (while an intoned or voiced current of air is driven during the closure into the cavity of the mouth, as in the case of the other sonant mutes); it is, then, rather a tongue-tip sound, or a front lingual. Sounds closely akin to it are made with different parts of the front tongue against different parts of the forward palate; hence the *d* is somewhat variously colored in various languages, and in some there are two diverse *d*'s, or even more than two. The *d*, as belonging to the fundamental or Germanic part of our language, has taken the place of a more original aspirate, namely, Sanskrit *dh*, Greek *θ*, Latin *ethest* *f*: thus, English *door* = Sanskrit *dhwra* = Greek *thura* = Latin *foras*. Its regular correspondent in German is *t*: thus, *tor* (usually written *thor*) = English *door*; but, under special conditions, also a *d*: thus, German *ende* = English *end*; German *gold* = English *gold*. The German *d* regularly corresponds to English *th*. (See *th*.) Our *d* has no variety of values; it is, however, not seldom made *surd*, or pronounced as *t*, as in *pick-ed*, *tipped*, *kissed*, and the like, being in older words of this kind a substitute, for mechanical uniformity of spelling, for earlier *t*; *missed* being formerly *miste*, *Anglo-Saxon miste*; *kissed*, formerly *kiste*, *Anglo-Saxon cyste*, etc. See -*ed*¹, -*ed*².

2. As a numeral, in the Roman system, *D* stands for 500; when a dash or stroke is placed over it, as *D̄*, it stands for 5,000.—3. As a symbol: (a) In music: (1) The second tone, or *re*, of the scale of *C*. The ratio between the vibration-numbers of these two tones, when in the relation of *do* and *re*, is $\frac{1}{2}$. The tone above *bas* *C* is represented by *D*, the octave above by *d*, etc. See *C*, 3. (2) A note which represents this tone. On the treble staff *D* stands on the first added space below, or on the fourth line (a); and on the bass staff it stands on the third line, or on the second added space above (b). When other clefs are used, the position of *D* is different. See *clef*, (3) The key-note of the key of two sharps (c).

On the keyboard of the organ or pianoforte, the white key or digital included in each group of two black keys. (5) The string in a stringed instrument that is tuned to the tone *D*, as the third string of the violin, etc. (b) In *chem.*, *D* is the symbol of *didymium*. (c) In *math.*, *d* is the sign of differentiation, ∂ of partial differentiation, δ of variation, *D* of derivation (commonly in the sense of taking the differential coefficient), Δ of difference, and ∇ of the Hamiltonian operator. Many analysts avoid the use of the letter in other senses than these. A letter subjoined to any of these signs of operation shows what is taken as the independent variable, and exponents show the number of times the operations are to be performed. Differentiation (especially when relative to the time) was formerly indicated in England by a dot over the sign of the quantity to be differentiated, this being the notation of Newton's fluxional calculus. (d) In the mnemonic words of logic, the sign of reduction to *darii*.—4. As an abbreviation: (a) In *Eng. reckoning* (*d.* or *d.*), an abbreviation of *denarius*, the original name for the English penny: as, £ *s. d.*, pounds, shillings, and pence; 2*s. 1d.*, two shillings and one penny. (b) Before a date (*d.*), an abbreviation of *died*. (c) In dental formulas, an abbreviation of *deciduous*, prefixed without

a period to the letters *i*, *c*, and *m*: thus, *di.*, deciduous incisor; *de.*, deciduous canine; *dm.*, deciduous molar: all being teeth of the milk-entention of a diphodont mammal. Thus, the milk- or deciduous dentition of a child is expressed by the formula

$$di. \frac{2-2}{2-2} \quad dc. \frac{1-1}{1-1} \quad dm. \frac{2-2}{2-2} = \frac{10}{10} = 20;$$

or, more simply, taking one half of each jaw only, *di. 2*, *dc. 1*, *dm. 2* × 2 = 20. In either case the numbers above the line are those of the upper teeth, and those below the line of the under teeth. See *dental*. (*d*) In *anat.* and *ichth.* (*d.* or *D.*), an abbreviation of *dorsal* (vertebra or fin, respectively). (*e*) In a ship's log-book (*d.*), an abbreviation of *drizzling*.

The dactyl appears to have been so called because, like a finger, it consists of one long and two short members.]

1. A unit of linear measure; a finger-breadth; a digit; used in reference to Greek, Egyptian, and Babylonian measures. The Egyptian dactyl was precisely one fourth of a palm, and was equal to 0.74 inch, or 18.7 millimeters. The Babylonian and Assyrian dactyla are by some authors considered as the fifth part, by others as the sixth part, of the corresponding palms. The ordinary Greek dactyl was one fourth of a palm, and its value in Athens is variously calculated to be from 1.85 to 1.93 centimeters.

2. In *pros.*, a foot of three syllables, the first long, the second and third short. The dactyl of modern or accentual versification is simply an accented syllable followed by two which are unaccented, and is accounted a dactyl without regard to the relative time taken in pronouncing the several syllables. Thus, the words *cheerily, verily, violate, and edify*, which on the principles of ancient metrics would be called respectively a dactyl (— — —), a tribrach (— — —), a Cretic (— — —), and an anapest (— — —), are all alike regarded as dactyls. The quantitative dactyl of Greek and Latin poetry is tetrasemic—that is, has a magnitude of four morae (see *mora*); and as two of these constitute the thesis (in the Greek sense) and two the arsis, the dactyl, like its inverse, the anapest (— — —), belongs to the equal (isorhythmic) class of feet. The true or normal dactyl has the ictus or metrical stress on the first syllable (— — —). Its most frequent equivalent or substitute is the dactylic spondee (— — —), in which the two short times are contracted into one long. Resolution of the long syllable (— — —) is rare.

If ye use too many *dactyls* together ye make your musick too light and of no solemn grandite, such as the amorous Elegies in court naturally require.

Pultenham, *Art of Eng. Poesie*, p. 106.

From long to long in solemn sort
Slow spondee stalks; strong foot! yet ill able
Ever to come up with *Dactyl* tri-syllable.

Coleridge, *Metrical Feet*.

3. In *anat.*: (a) A digit, whether of the hand or foot; a finger or a toe. (b) A toe or digit of the hind foot only, when the word *digit* is restricted to a finger.—4. In *zool.*, a dactylus.—5. The piddock, *Pholas dactylus*. See *dactylus* (c).—6. *Zoic dactyls*, a series of cyclic dactyls with a trochee in the first place. See *logædic*.—7. *Anapestic dactyl*, a dactyl substituted for an anapest, and consequently taking the ictus on its second syllable (— — — for — — —).—8. *Cyclic dactyl*. See *cyclic*, 3.

It contains African frogs without a tongue, with a concealed tympanic membrane, maxillary and premaxillary teeth, webbed hind feet, and claws on the three inner toes, from which latter character the name of the genus is derived. The sacral diapophyses are dilated, and the coracoids and precoracoids are subequal, strongly divergent, and connected by a broad, double, not overlapping cartilage. Also called *Xenopodidæ*.

Dactyli¹ (dak'ti-li), *n. pl.* [L., < Gr. δάκτυλοι ('Ιδαίοι, of Ida, in Crete): see def. Cf. *dactyl, n.*] In *classical antiq.*, a class of mythical beings, guardians of the infant Zeus, inhabiting Mount Ida in Phrygia or in Crete, to whom the discovery of iron and the art of working it were ascribed. They were servants or priests of Cybele, and are sometimes confounded with the Curetes, the Cabiri, and the Corybantes. The traditions about them and their place of abode vary.

dactyli², *n.* Plural of *dactylus*.

dactylic (dak-til'ik), *a.* and *n.* [L. *dactylicus*, < Gr. δακτυλικός, < δάκτυλος, a dactyl; see *dactyl*.] 1. *a.* In *pros.*, constituting or equivalent to a dactyl; pertaining to or characteristic of a dactyl or dactyls; consisting of dactyls: as, a *dactylic foot*; a *dactylic spondee*; *dactylic rhythm* or meter; *dactylic verses*. The dactylic rhythm in classical poetry was regarded as especially majestic and dignified; a continuous sequence of dactyls, however, produced a relatively lighter and more animated effect, an admixture of spondee giving a more or less heavy or retarded movement to the verse. The most frequent dactylic meter is the hexameter. Other dactylic meters were used in Greek lyric poetry, and in the drama, especially in the earlier period, or in passages expressing lamentation (monodies and commatias). See *hexameter* and *elegiac*.

This at least was the power of the spondee and *dactylic* harmony.

The classical *dactyliomancy*, of which so curious an account is given in the trial of the conspirators Patricius and Hilarus, who worked it to find out who was to supplant the emperor Valens. A round table was marked at the edge with the letters of the alphabet, and with prayers and mystic ceremonies a ring was held suspended over it by a thread, and by awing or stopping towards certain letters gave the responsive words of the oracle.

See *shogun*. Though exercising independent authority in their own domains, the daimios acknowledged the mikado as the legitimate ruler of the whole country. During the Tokugawa shogunate (1603-1868) the daimios gradually became subject to the shoguns, who compelled them to live in Yedo, with their families and a certain number of their retainers, for six months of every year, and on their departure for their own provinces to leave their families as hostages. The number of daimios differed at different times, according to the fortunes of war and the caprice of the shoguns. Just before the abolition of the shogunate there were 255, arranged in five classes, with incomes ranging from 10,000 to 1,027,000 koku of rice per annum. In 1871 the daimios surrendered their lands and privileges to the mikado, who granted pensions proportioned to their respective revenues, and relieved them of the support of the samurai, their military retainers. These pensions have since been committed into active bonds, redeemable by government within thirty years from date of issue. The title has been abolished, and that of *kuwazoku* bestowed upon court and territorial nobles alike. See *kuwazoku*.

Specifically—7. To diminish or destroy the oscillation of (a metallic body in motion in a

magnetic field). When a conductor is moved in a magnetic field, or when a magnet is moved in the vicinity of a conductor, there will be, in general, an induced current generated which will oppose the motion to which it is due. The moving body will act as if immersed in a viscous liquid, and will more quickly come to rest. Advantage is taken of this fact in stilling the vibrations of a magnetic needle in a galvanometer or a compass by placing masses of conducting metal near the vibrating body. Damping is also accomplished by attaching to the needle a disk, cylinder, or vane, which swings in a liquid or in air.

[*Dampen* is now more common in the literal sense, and is sometimes used in the derived senses.]

Some forms of dampers are designed to be controlled by automatic regulators, which are operated either by the heat of the fire directly (by contraction or expansion of a metal) or, when connected with a steam-boiler, by the pressure of the steam. (2) In the pianoforte, a small piece of wood or wire thickly covered with felt, which rests upon the strings belonging to each key of the keyboard. When the key is struck the damper is drawn away from the strings, but the instant the key is released the damper returns and checks the vibrations of the strings. The dampers of all the keys can be raised by pressing the damper-pedal (which see), so that the vibration of the strings can be prolonged after the finger has left the key. (3) The mute of a brass instrument, as a horn. (4) An arrangement for arresting the vibrations of a magnetic needle. See *damp*, *v. t.*, 7. Darwinism (där-wi-ni-izm), *n.* [F. *darwin* (see def.) + *-ism*.] 1. The body of biological doctrine propounded and defended by the English naturalist Charles (Charles Robert) Darwin (1809–1882), especially in his works "The Origin of Species" (1859) and "The Descent of Man" (1871), respecting the origin of species.

It is, in general, the theory that all forms of living organisms, including man, have been derived or evolved by descent, with modification or variation, from a few primitive forms of life or from one, during the struggle for existence of individual organisms, which results, through natural selection, in the survival of those least exposed, by reason of their organization or situation, to destruction. It is not to be confounded with the general views of the development or evolution of the visible order of nature which have been entertained by philosophers from the earliest times. (See *evolution*.) That which is specially and properly *Darwinian* in the general theory of evolution relates to the manner, or methods, or means by which living organisms are developed or evolved from one another: namely, the inherent susceptibility and tendency to variation according to conditions of environment; the preservation and perfection of organs best suited to the needs of the individual in its struggle for existence; the perpetuation of the more favorably organized beings; and the destruction of those less fitted to survive: the operation of natural selection, in which sexual selection is an important factor; and the general proposition that at any given time any given organism represents the result of the foregoing factors acting in opposition to the hereditary tendency to revert to the type, or "breed true." See *selection*.

=Syn. *Dash, Smash, Shatter, Shiver, Crush, Mash*. That which is *dashed* does not necessarily go to pieces: if it is broken, the fact is commonly expressed. That which is *smashed*, *shattered*, or *shivered* is *dashed* to pieces suddenly, with violence, at a blow or in a collision. *Smashing* is the roughest and most violent of the three acts; the word expresses the most complete disruption or ruin: as, the drunken soldier *smashed* (*shattered, shivered*) the mirror with the butt of his musket. The use of *smash* or *mash* for *crush* (as, his head was *smashed*, I *mashed* my finger) is colloquial. *Shatter* and *shiver* differ in that *shatter* suggests rather the flying of the parts, and *shiver* the breaking of the substance; and the pieces are more numerous or smaller with *shiver*. That which is *crushed* or *mashed* is broken down under pressure; that which is *mashed* becomes a shapeless mass: sugar and rock are *crushed* into powder, small particles, or bits; apples are *crushed* or *mashed* into pulp in making cider; boiled potatoes are *mashed*, not *crushed*, in preparing them for the table.

They that stand high have many blasts to shake them;
And, if they fall, they *dash* themselves to pieces.

7. (a) In writing and printing, a horizontal stroke or line of varying length, used as a mark of punctuation and for other purposes; specifically, in printing, a type the face of which consists of such a line. The dashes regularly furnished in a font of type are called respectively the *em dash* (—, a square of the size of the font), the *en dash* (—, half a square), the *two-em dash* (—, two squares), and the *three-em dash* (—, three squares). In punctuation, the *em dash* is used to note a sudden transition or break of continuity in a sentence, more marked than that indicated by a comma, and also at the beginning and end of a parenthetical clause—properly of one more directly related to the general sense than a true parenthesis. (See *parenthesis*.) The *em* or the *en dash* is often used to indicate the omission of the intermediate terms of a series which are to be supplied in reading, being thus often equivalent to "to . . . inclusive": thus, Mark iv. 3—20, or 3—20 (that is, verses 3 to 20, inclusive); the years 1880—83 (that is, 1880 to 1883). As a mark of hiatus or suppression, the dash—usually one of the longer ones—stands for something omitted, as a name or part of a name, the concluding words of an unfinished sentence, or the connecting words of a series of broken sentences. Various other more or less arbitrary uses are made of dashes, as in place of *da.* (*ditto*) to indicate repetition of names in a catalogue or the like, as a dividing line between sections, articles, or other portions of matter, etc.

Observe well the *dash* too, at the end of this Name.
Wycherley, Plain Dealer, v. 1.

(c) In harpsichord-music, a coulé (which see).—9. In zoöl., a longitudinal mark, generally rounded and clearly defined at one end, and tapering or gradually becoming indistinct at the other, as if produced by a drop of colored liquid *dashed* obliquely against the surface, or by the rough stroke of a pen. Such marks are very common on the wings of the *Lepidoptera*.—10. A present made by a trader to a chief on the western coast of Africa to secure permission to traffic with the natives.—11. There are four subfamilies: *Dasyppodinae* (the encouberts), *Xenuriinae* (the kabassous), *Prionodontinae* (the kabalassous), and *Tolyptepinae* (the apars). Also *Dasyptidæ*.

The nails of the feet are hoof-like; the fore feet are 5-toed; the hind feet have also 5 toes (paca), or only 3 (agoutis); the tail is rudimentary or very short; the ears are low; and the upper lip is not cleft. Contrary to the rule in the hystricine series of rodents, the clavicles are rudimentary; and the molar teeth are semi-rooted, and the incisors long. The *Dasyproctidæ* are related to the cavies and chinchillas (see *cavy* and *chinchilla*); they are confined to the Neotropical region, inhabiting parts of Mexico, some of the West Indies, and the greater part of South America, especially wooded and watered localities. They have 4 incisors in each half of the upper and 3 in each half of the lower jaw; the canines well developed; the hind feet with the clawless hallux small and rudimentary, rarely apposite; the fibula of proportionate length; the stomach simple; and no cæcum. They are predatory carnivorous or insectivorous marsupials of Australia, Tasmania, New Guinea, and some other islands. They are divided into the two subfamilies *Dasyurinae* and *Myrmecobiinae*. These animals are sometimes known indiscriminately as brush-tailed opossums.

Dasyurinae (das'i-ūr'i-nē), *n. pl.* [NL., < *Dasyurus* + *-inae*.] A subfamily of *Dasyuridæ*; the *dasyures*. The tongue is not specially extensible, and the premolars and molars are not more than 7 in number; in these respects the subfamily is contrasted with *Myrmecobiinae* (which see). The leading genera are *Dasyurus*, *Sarcophilus*, and *Thylacinus*, or the true, the ursine, and the thylacine *dasyures*, and *Phascogale*; the last is properly made the type of a different subfamily, *Phascogalinae*.

He is generally a bishop, and is assisted by a subdatary, who is also in holy orders. When a cardinal is elected to the office of *datary* he bears the title of *prodatary*. See *datary*².

That part of a writing or an inscription which purports to specify the time when, and usually the place where, it was executed. A full date includes the place, day, month, and year; but in some cases the date may consist of only one or two of these particulars, as the year on a coin. In letters the date is inserted to indicate the time when they are written or sent; in deeds, contracts, wills, and other papers, to indicate the time of execution, and usually the time from which they are to take effect on the rights of the parties; but the written date does not exclude evidence of the real time of execution or delivery, and consequent taking effect. In documents the date is usually placed at the end, but may be at the beginning, as it is now generally in letters.

Bohem. *daktyl*, < L. *dactylus* (NL. also, after Rom., *dataulus*), < Gr. δάκτυλος, a date, so called from its shape, lit. a finger, also a dactyl: see *dactyl*, a doublet of *date*³.] The fruit of the date-palm, *Phoenix dactylifera*, used extensively as an article of food by the natives of northern Africa and of some countries of Asia. date-line (dāt'lin), *n.* The boundary-line between neighboring regions where the calendar day is different. This line runs through the Pacific ocean, and is supposed to coincide with the meridian of 12 hours or 180° from Greenwich; but it practically follows a somewhat devious course, and is sometimes confused. Thus the Sundays of the Russian and of the American settlers in Alaska formerly fell upon different days. On the east of the date-line the nominal date is one day earlier than on the west of it; so that the American Sunday in Alaska coincides with the former Russian Monday.

date-mark (dāt'märk), *n.* A special mark stamped on an article of gold or silver to indicate the year of manufacture. Thus, in the London Goldsmiths' Company, during the twenty years from 1856 to 1875 this mark was a letter of the alphabet in small Old English character; for the next twenty years, beginning in 1876 and ending in 1895, Roman capitals were adopted.

date-palm (dāt'päm'), *n.* The common name of *Phoenix dactylifera*, the palm-tree of Scripture: also called *date-tree*. Next to the coconut-tree, the date is unquestionably the most interesting and useful of the palm tribe. As with the coconut-tree, nearly every part is applied to some useful purpose, and the fruit not only affords the principal food of the inhabitants of various countries, but is a source of a large part of their traffic. It is cultivated in immense numbers all over the northern part of Africa as well as in southwestern Asia, and is found through southern Europe, though rarely productive there. Its stem shoots up to the height of from 60 to 80 feet, without branch or division, and is of nearly the same thickness throughout its length. From the summit it throws out a magnificent crown of large feather-shaped leaves, and a number of spadices, each of which in the female plant bears a bunch of from 180 to 200 dates, each bunch weighing from 20 to 25 pounds. The fruit is eaten fresh or dried. The best dates of commerce are obtained from the coast of the Persian gulf, where the tree is cultivated with great care, and where over 100 varieties are known. The date-palm was probably originally derived from the wild date-palm, *P. sylvestris*, which is found throughout India, and is planted very extensively in Bengal, chiefly for the production of toddy and sugar. See *Phoenix*.

Date-palm (*Phoenix dactylifera*).

R. F. Burton, El-Medinah, p. 245.

date-wine (dāt'win), *n.* The fermented sap of the date-palm.

datholite (dath'ō-lit), *n.* See *datolite*.

datation (dä'shōn), *n.* [*L. datio(n)*, *< dare*, pp. *datus*, give: see *date*¹, *date*².] In civil law, the act of giving: as, the *datation* of an office: distinguished from *donation* or *gift* in that it does not imply beneficence or liberality in the giver.

Europe, where it is used as a substitute for Peruvian bark, as a yellow dye, and in the manufacture of cordage.

Datisceae (dat-is-kä'sē-ē), *n. pl.* [NL., *< Datisca + -aece*.] A small natural order of plants, with apetalous flowers, but having closer affinities with the *Cucurbitaceae* and *Begoniaceae* than with any of the apetalous orders, and united by Baillon with the *Saxifragaceae*. There are only three genera, of which *Datisca* is the best-known.

datiscin (da-tis'in), *n.* [*< Datisca + -in*.] A substance (C₂₁H₂₂O₁₂) having the appearance of grape-sugar, first extracted by Braconnot from the leaves of *Datisca cannabina*. It has been used as a yellow dye.

datisi (da-ti'si), *n.* The mnemonic name given by Petrus Hispanus to that mood of the third figure of syllogism in which the major premise is universal and affirmative, and the minor premise and conclusion are particular and affirmative. These distinctions of quantity and quality are indicated by the vowels of the word, *a-i-i*. The letter *s* after the second vowel shows that the mood is reduced to direct reasoning by the simple conversion of the minor, and the initial *d* shows that the resulting mood is *darri*. The following is an example of a syllogism in *datisi*: All men irrationally prejudiced have weak minds; but some men irrationally prejudiced are learned; hence, some learned men have weak minds.

dativ (dä'tiv), *a. and n.* [= *F. datif* = *Pr. dative* = *Sp. Pg. It. dativo* = *D. datief* = *G. Dan. Gr. πρῶσις δοτική), or simply *dativus*, the *dativ* case; *< datus*, pp. of *dare*, give: see *date*¹, *date*².] I. *a. 1.* In gram., noting one of the cases of nouns and pronouns and adjectives in Indo-European languages, and in some others, used most commonly to denote the indirect or remoter object of the action of a verb, that to or for which anything is done. This case is found in all the ancient languages of our family, and is widely preserved even among the later. Though nowhere distinguished in form from the accusative or objective in modern English, it is really present in such expressions as, give him his due; show this man the way; and him, whom, them, and (in part) her are historically datives, retaining a dative termination. The precise value of the original Indo-European dative is a matter of doubt and dispute. Abbreviated *dat*.

2. In law: (a) Noting that which may be given or disposed of at pleasure; being in one's gift. (b) Removable, in distinction from *perpetual*: said of an officer. (c) Given or appointed by a magistrate or a court of justice, in distinction from what is given by law or by a testator: as, an executor *dative* in Scots law (equivalent to an administrator).—Decree *dative*, executor *dative*. 3. The whole time or period of one revolution of the earth on its axis, or the space of twenty-four hours; specifically, the interval of time which elapses between two consecutive returns of the same terrestrial meridian to the sun. In this latter specific sense it is called the *natural*, *solar*, or *astronomical day*. Since the length of this day is continually varying, owing to the eccentricity of the earth's orbit and the obliquity of the ecliptic, a *mean solar day* (the *civil day*) is employed, which is the average period of one revolution of the earth on its axis relative to the sun's position considered as fixed. The day of twenty-four hours may be reckoned from noon to noon, as in the *astronomical* or *nautical day*, or from midnight to midnight, as in the *civil day* recognized in the United States, throughout the British empire, and in most of the countries of Europe. The Babylonians reckoned the *civil day* from sunrise to sunrise; the Umbrians, from noon to noon; the Athenians and Hebrews, from sunset to sunset; and the Romans, from midnight to midnight.

And the evening and the morning were the first *day*.

A French preposition, found in English only in some French phrases, as *couleur de rose*, or in proper names, as in *Simon de Montfort, Cœur de Lion, De Vere*, etc., either of Middle English origin, or modern and mere French. Its use in such names, following the name proper, and preceding what was originally, in most cases, the name of an estate, led to its acceptance as evidence of noble or gentle descent, corresponding in this to the German *von* and the Dutch *van*. But as the particle in proper names often originated without any such implication, and has also been often assumed without authority, it is in itself of no value as such evidence.

2. A Latin preposition, meaning 'from' or 'of,' occurring in certain phrases often used in English: as, *de novo*, anew; *de facto*, of fact; *de jure*, of right.

dis-, dif-. 1. A verb-prefix of Latin origin, expressing in Latin, and hence with modifications in modern speech, various phases of the original meaning 'from, away from, down from.' (1) Separative, denoting departure or removal—'off, from off, away, down, out,' or cessation or removal of the fundamental idea: *de-* privative, equivalent to *un-* or *dis-* privative. (2) Completive—'through, out, to the end,' etc. (3) Intensive: a force often lost in English. (See examples following.) In some words the separative or privative force of this prefix is felt in English, as in *decompose*, *demote*, being in such meaning often used as an English prefix (*de-* privative), as in *decentralize*, *de-Saxonize*, *deceit*, etc. It is less distinctly felt in words like *depress*, *detract*, etc.; and in many words, where it has in Latin the completive or intensive force, its force is not felt in English, as in *deride*, *denote*, etc.

2. In some words a reduced form of the original Latin prefix *dis-*, Latin *de-* and *dis-* being in Old French and Middle English more or less merged in form and meaning (see *dis-*). See *defer*², *deface*, *defame*, *deery*, etc.

Sw. *diakon*, *deacon*), = OF. *diacne*, *diacre*, F. *diacre* = Pr. *diacre*, *diague* = Sp. *diácono* = Pg. It. *diacono*, < LL. *diaconus* = Goth. *diakonius*, a deacon, < GR. *δίακονος*, a servant, waitingman, messenger, eccles. a deacon; of uncertain origin; perhaps related to *διώκειν*, pursue, cause to run. The Teut. forms appear to have been in part confused with the forms belonging to L. *decanus*, a dean (see *dean*), and with those belonging with G. *degn*, etc., AS. *thegn*, E. *thane* (see *thane*).] 1. *Eccles.*, one of a body of men, either forming an order of the ministry or serving merely as elected officers of individual churches, whose chief duty is to assist a presbyter, priest, or other clergyman, especially in administering the eucharist and in the care of the poor. (a) In the apostolic church, one of an order of ministers or church-officers, inferior to apostles and presbyters, whose duty it was to serve at the Lord's Supper, or agape, and to minister alms to the poor. It is generally believed that the institution of this office is recorded in Acts vi. 1-6, where, although the word *deacon* (*δίακονος*, minister) is not used of the seven persons appointed, the corresponding words "to minister or serve" (*διακονεῖς*) and "ministration" (*διακονία*) are employed. By an analogy with the Mosaic hierarchy, St. Clement of Rome in the apostolic age called the deacons *Levites*, and this use of the word *Levite* long remained frequent. (b) In the early Christian church, one of the third order of the ministry, of lower rank than bishops and presbyters. The deacons applied complete unction to men in preparation for baptism, but anointed women on the forehead only, assisted the celebrant at the eucharist, read the gospel and made proclamations during the liturgy, maintained order in the congregation, and cared for the poor and sick. Those attached to episcopal sees acted as the bishop's adjutants, messengers, and representatives, and when belonging to a great patriarchal or metropolitan see possessed much influence. Hence—(c) In the Greek Church, one of the third order of the ministry, similar in rank and duties to the officer of the same name in the early church. (d) In the Roman Catholic Church, a member of the third order of the ministry. He assists the priest throughout the celebration of the eucharist or mass, and reads the gospel. The principal assistant to the celebrant at a solemn celebration is called the *deacon*, and vested accordingly, whether in deacon's, priest's, or bishop's orders. (e) In the Anglican Church, a member of the third order of the ministry. His duties are to assist the priest in divine service, especially at the holy communion, help in distributing the elements to the people, read the Scriptures, especially the eucharistic gospel, catechize, baptize infants in the absence of the priest, preach if licensed by the bishop, and seek out the sick and poor and make their wants known to the curate. Deacons cannot consecrate the eucharist, pronounce absolution, or give benediction. The bishop, priest, or deacon who acts as principal assistant at the holy communion is called the *deacon* or *gospelier*. (f) In the Methodist Episcopal Church, a member of an order of the ministry next below that of elder. The deacons are elected by the annual conference, are ordained by the bishop, and are authorized to assist in the administration of the eucharist, to administer the rites of baptism and marriage, and to perform the duties of a traveling preacher. (g) In the Baptist and Congregational churches, one of two or more officers elected by each church to distribute the elements in the communion after they have been consecrated by the minister, and to act as the advisers of the pastor and as the almoners of the charities of the church. (h) In the Presbyterian Church, one of a number of officers elected by a congregation and ordained by the minister to assist the session in the care of the poor and in the general management of the secular affairs of the church. Deacons are not always appointed, their place being sometimes supplied by the elders. (i) In the Lutheran Church in the United States, one of a number of laymen chosen to at-

tend to the charities and temporalities of a congregation. With an equal number of elders and the pastor, the deacons constitute the council of each church to manage its temporal and spiritual affairs. One of an ecclesiastical order of women in the early church, who discharged for members of their own sex those parts of the diaconal office which could not conveniently or fitly be performed by men. They acted as doorkeepers and kept order on the women's side of the congregation, assisted at the baptism of women and administered the unction before baptism except the anointing of the forehead, instructed female catechumens, took charge of sick and poor women, and were present at interviews of the clergy with women. Such an order was especially needed in those Christian countries where Oriental seclusion of women prevailed. Deaconesses were required to remain unmarried, and were generally selected from the consecrated virgins or from the order of widows. In the Eastern Church the order continued into the middle ages, but it is not certain when it became extinct. In the Western Church it was abolished by successive decrees of councils during the fifth and succeeding centuries, and became finally extinct about the tenth. Abbesses were sometimes called deaconesses after the order became obsolete.
